Movie app report.

Based on the information provided

Step1:

- I Got image urls from the vue website 6 – 8 movies
- Got info about the movies store each in a note pad under title, which will be used in the Movie.json file

Step2:

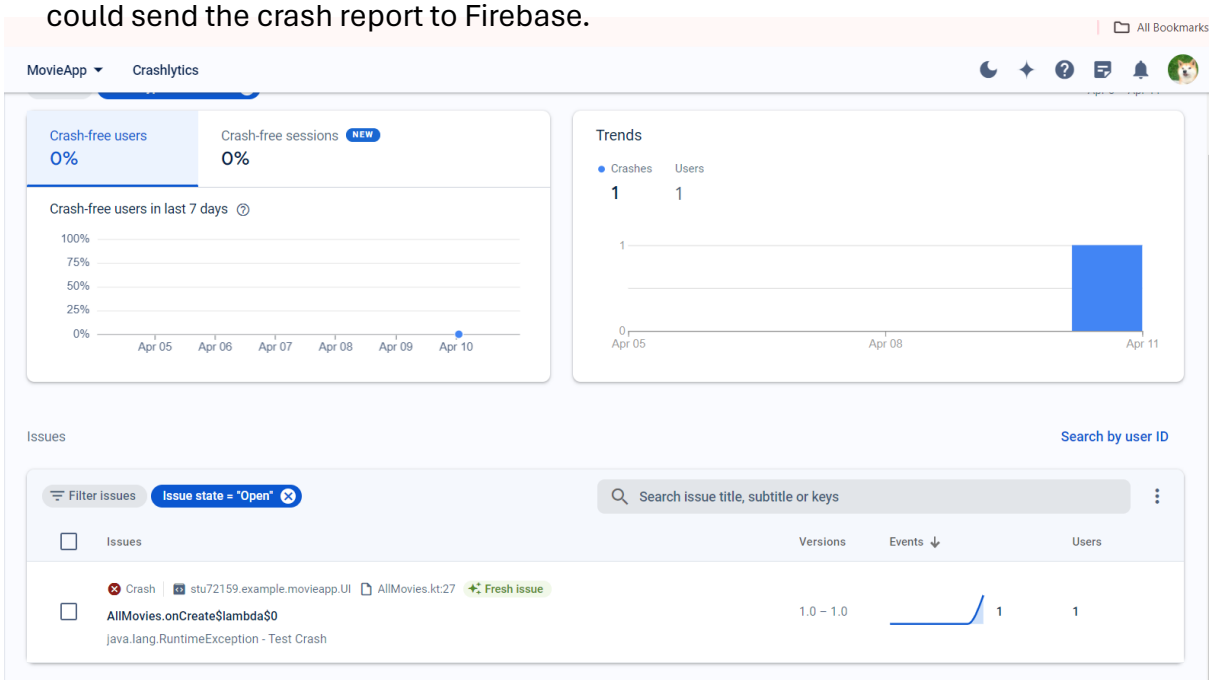
- I had to get much needed information about the use of studio(Kotlin)
- Then Set up a firebase account, which was used for “Crashlytics”

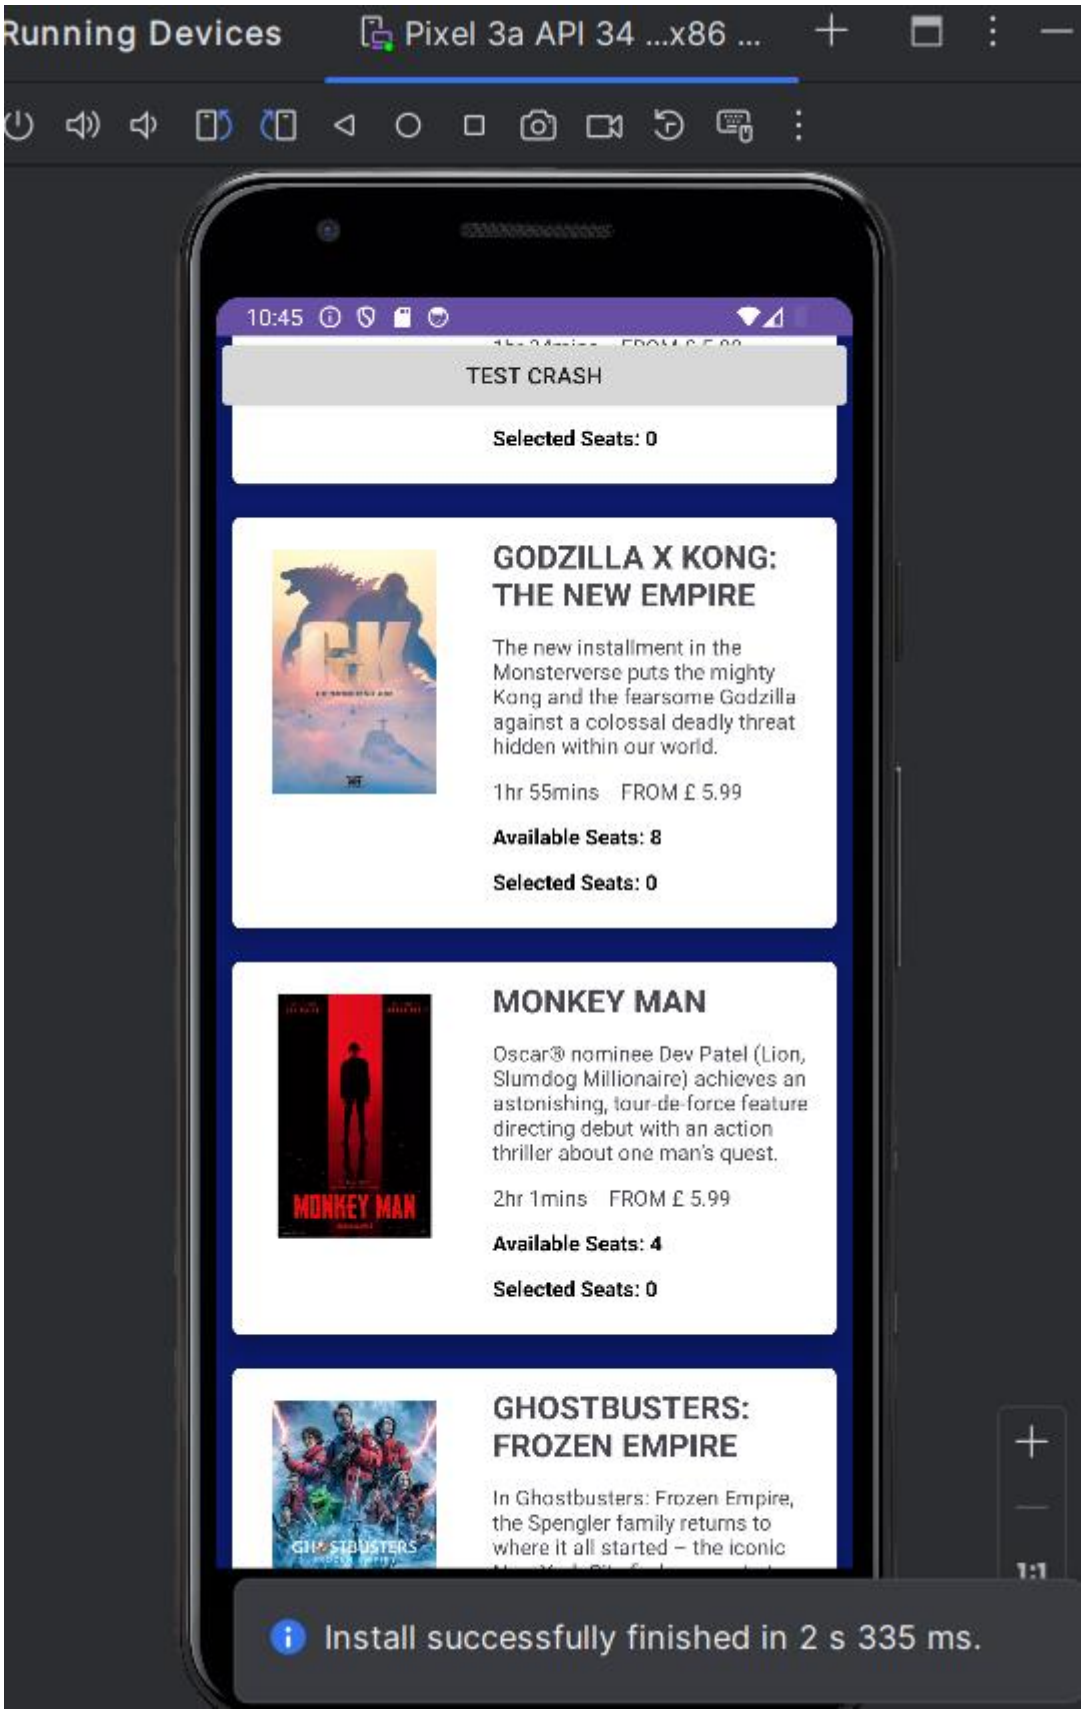
Step3:

- Started off the project. Starting with the first main page, by creating a kt file and layout xml file and other needed files for reference.
- Same as the second page kt and layout file
- Create a few implementations and variables
- Downloaded needed icons and imported the Drawables.

After completion the page was displaying well and crashing at times. So went on firebase for a crash test.
Steps:

- Linked my app to my firebase account
- Added the Crashlytics SDK and plugin to my app
- Opened my app from the test device or emulator.
- Pressed a "Test Crash" button that i added using the code provided.
- Went on firebase for results, after your app crashed, restarted it so that ther app could send the crash report to Firebase.



With the help of my friend called chat.


I got around the issue and app was built successfully.
